# IIDD 2 FINAL COURSE PROJECT

## Individual Web Portfolio for Industry & OJT Placement
## Project Documentation

| | |
|---|---|
| **Course Code & Title:** | IIDD 2 – Industrial Interface Design and Development 2 |
| **Project Name:** | John Patrick S. Sunga – OJT Web Portfolio |
| **Student Full Name:** | John Patrick S. Sunga |
| **Student ID:** | 2023104740 |
| **Program & Section:** | BIT – Computer Technology, 4CG1 |
| **Instructor:** | Vinna Ramos |
| **Live Deployment URL:** | https://[username].github.io/ojt-portfolio/ |
| **Date of Submission:** | November 6, 2026 |

# Section 1: Developer Profile & Links

**Target Industry Track / Role**

Technical Support & Systems Intern

**Live Deployment URL**

https://[username].github.io/ojt-portfolio/

**Public GitHub Repository Link**

https://github.com/[username]/ojt-portfolio

## Professional Elevator Pitch

I am an adaptable, tech-savvy Computer Technology student at the College of Industrial Technology, Bulacan State University, with strong analytical thinking and a natural knack for troubleshooting. I built a CPU Scheduling Simulator that applies operating systems concepts and a Device Info Inspector that helps support teams collect accurate device details. I learn quickly and am ready to deliver value to a partner company's technical support or systems team during my 500 training hours.

## Cover Letter

November 6, 2026

The Hiring Manager
Human Resources Department

Dear Hiring Manager,

I am writing to apply for an On-the-Job Training position as a Technical Support and Systems Intern at your company. I am a Bachelor of Industrial Technology student majoring in Computer Technology at Bulacan State University – College of Industrial Technology, and I am required to render 500 training hours starting the 2nd Semester of A.Y. 2026–2027.

I am highly adaptable and enjoy finding the root cause of technical problems. My studies have given me a foundation in operating systems, computer hardware, and basic C++ programming. To apply this, I built a CPU Scheduling Simulator that compares FCFS, SJF, Priority, and Round Robin scheduling, and a Device Info Inspector that turns a user's device details into a ready-to-send support report.

I learn new tools quickly and would welcome the chance to grow with your team. My portfolio, CV, and live project demos are available online. Thank you for your time and consideration. I look forward to hearing from you.

Respectfully yours,

John Patrick S. Sunga

# Section 2: Technology Stack & AI Tooling

### 1. Coding Environment & Core Stack

The portfolio is built with semantic HTML5 (header, nav, main, section, article, figure, table, footer) and CSS3 using Flexbox, CSS Grid, custom properties, and media queries, with a small vanilla JavaScript file that highlights the current section in the navigation. Both projects use plain JavaScript: the scheduler implements four scheduling algorithms, and the inspector uses standard browser APIs such as navigator and screen. I used Visual Studio Code to review the code and Google Chrome DevTools to test screen sizes and check the Console for errors. The fonts are Barlow Condensed for headings, Barlow for body text, and JetBrains Mono for labels, loaded from Google Fonts.

### 2. AI & Vibe Coding Tools Used

I used Claude (Anthropic) through the Claude app as my AI development tool. I chose it because I could send my details and photo in one message and it produced the complete folder structure from the guidelines, tested the pages in a browser, and generated my CV.

### 3. Deployment Platform

I chose GitHub Pages because it is free, it is the recommended option in the guidelines, and it serves the site directly from the public repository that holds my source code. The site is deployed from the *main* branch, root folder.

# Section 3: Prompt Engineering Strategies & Iteration Log

## 1. Prompting Strategies Applied

### Technique 1: Context-setting with my own details

I gave the AI my student number, full name, contact details, address, objective, study background, and current skills (Operating Systems and basic C++), together with my formal photo, in one message. This gave the AI real information for every required section instead of generic placeholder text.

### Technique 2: Open-ended expansion with review

Because my skills list was short, I asked the AI to "add skills and everything modify it". The AI expanded my skills into the categories required by the guidelines and built two projects around operating systems and troubleshooting. I then reviewed every added skill and kept only the ones I can actually demonstrate, since a recruiter may ask me about any of them.

## 2. Prompt Iteration Log

### Instance A (Layout / Component Issue)

*Initial Prompt Given:*

> *My student number, name, contact details, address, objective, study background, and skills (Operating Systems, basic C++), followed by "add skills and everything modify it", with my photo attached.*

*Flaw in AI Output:* The CPU Scheduling Simulator page scrolled sideways on a 390px phone screen, making the page 466px wide. The process table was correctly placed inside its own scrolling box, but a hidden screen-reader label inside the table escaped that box and stretched the whole page.

*Corrective Follow-Up Prompt / Strategy Used:*

> *"The CPU scheduler page scrolls sideways on my phone. Find which element is wider than the screen and fix it without removing the table's horizontal scroll."*

The AI listed every element extending past the screen edge, found the hidden label, and added *position: relative* to the table's scroll container so the label stays inside it. The page width then matched the 390px screen.

**Instance B (Styling / Behavioral Issue)**

*Initial Prompt Given:*

> *Same prompt as Instance A.*

*Flaw in AI Output:* In the scheduler's Gantt chart, the time label "0" under the first block was cut in half because it sat slightly outside the chart's scrolling area. A Gantt chart that does not clearly start at 0 is confusing when checking waiting times.

*Corrective Follow-Up Prompt / Strategy Used:*

> *"The 0 at the start of the Gantt chart is cut off. Add enough space so the first and last time labels are fully visible."*

The AI added padding on both sides of the Gantt chart so the first and last time labels are no longer clipped, then retook the project screenshot to show the full chart.

# Section 4: Real Bottlenecks & Practical Problem-Solving

**Bottleneck 1: Layout & Mobile View Quirks**

The biggest mobile issue was the CPU scheduler page scrolling sideways on a phone, described in Instance A. On the main portfolio, the datasheet-style tables also needed changes for small screens: below 640px, the internship specification table, the academic details list, and the contact list switch from two columns to stacked label-and-value rows, the photo moves above my name, and the buttons become full width. I tested at 390px, 820px, and 1280px widths in DevTools and confirmed there was no horizontal scrolling on the portfolio or either project. [Add anything you noticed when you opened the live site on your own phone.]

**Bottleneck 2: Live Deployment / Asset Loading Issues**

Because GitHub Pages serves the site under */ojt-portfolio/*, every stylesheet, image, CV, and project link uses a relative path such as *assets/css/style.css*. When uploading, the contents of the *Sunga_JohnPatrick_IIDD2_Final* folder must be dragged in, not the folder itself and not files chosen one by one, or the *assets* and *projects* folders are lost. GitHub Pages also has to be enabled in Settings → Pages (Deploy from a branch, *main*, */ (root)*). [Describe any issue you actually hit when uploading or opening the live site.]

**Bottleneck 3: Working with AI-Generated Code**

The hardest part was trusting the scheduling results. I solved a sample set of four processes by hand (P1 to P4 with arrival times 0 to 3) and compared my answers with the simulator. The average waiting times matched for every algorithm: 5.75 for FCFS, 5.25 for SJF and Priority, and 9.75 for Round Robin with a time quantum of 2. Round Robin was the most difficult to verify because newly arrived processes must join the queue before the process that was just preempted, so I traced the queue step by step to confirm the Gantt chart order.

# Section 5: Experience Reflection & OJT Readiness

**1. Human vs. AI Roles**

The AI was best at building a complete, structured portfolio quickly and turning my short skills list into the categories required by the guidelines. It also cleaned up my objective, which still contained the placeholder "[Company Name]". However, it introduced small layout bugs that only showed up when testing, and I had to check that every skill it added was something I can actually explain. Verifying the scheduling math by hand, deploying to GitHub Pages, and testing on my own devices required my own work.

**2. OJT Industry Readiness**

The Featured Projects section best shows my readiness. The Device Info Inspector reflects a real helpdesk task: collecting accurate device details from a user so a problem

can be solved faster. The CPU Scheduling Simulator shows that I understand how an operating system manages processes, which supports the systems side of IT work.

**3. Future Upgrades**

Before sending my portfolio to companies, I plan to add preemptive SJF (Shortest Remaining Time First) to the simulator and add a Certifications section for any IT trainings I complete. I also want to add a printable version of the device report for offline support requests.

## Section 6: Proof of Deployment & Screenshots

**Full-page desktop view (live site)**

[Insert screenshot: the live site on desktop, with the browser address bar visible]

**Full-page mobile view (live site)**

[Insert screenshot: the live site on your phone, with the address bar visible]

**Active public GitHub repository**
